Purpose:

This report shows planners whether customer demand is being met by supply, when that supply is available, and where the shortfalls are, so they can act before a gap becomes a bottleneck.

Question it answers : For each demand line: how much arrived on time, how much arrived late, and how much never arrived?

How to use it: Start on Overview and filter by region, date, product family or customer. Right-click a bar or month and choose Drill through, then Demand detail. Right-click a Demand ID, then Drill through, then Supply detail, to see when each supply arrives against the need-by date.

How demand is matched to supply: Demand and supply are matched on Demand ID. Earliest supply fills the demand first, up to the demand quantity. Supply available on or before the need-by date counts as on time, late supply.

Worked example: Demand of 10,000 with a need-by date of 15 Nov. 6,000 arrives on 10 Nov, 2,500 on 28 Nov, and 1,500 never arrives. That is 6,000 on time, 2,500 late and 1,500 not met, so the line status is Partially Met.

Data; All data is synthetic and was created for this portfolio project. It does not come from any employer or customer.

Limits; The report compares need-by dates with supply available dates. It does not model capacity, stock on hand or consumption. Supply with no demand is outside the scope of this version.

S.No ▲	term	meaning
1	Fully Met On Time	All of the demand quantity arrived on or before the need-by date.
2	Fully Met Late	All of the demand quantity arrived, but all of it after the need-by date.
3	Met, Partly Late	All of the demand quantity arrived. Part was on time and part was late.
4	Partially Met	Some of the demand quantity never arrived. The rest can be on time, late, or both.
5	Not Met	None of the demand quantity arrived.
6	Need-by date	The date the customer needs the product.
7	Supply available date	The date a supply line is available to ship.
8	Days vs need-by	Supply available date minus need-by date. Negative means early, positive means late.
9	Met on time qty	Supply that counts toward the demand and is available on or before the need-by date.
10	Met late qty	Supply that counts toward the demand and is available after the need-by date.
11	Not met qty	Demand minus met on time minus met late. Quantity with no supply.
12	Fulfilment %	(Met on time + met late) / demand.
13	On time %, Met late %, Not met %	Each quantity divided by demand.
14	Total supply	All supply quantity in the current filter. It can be above counted supply when supply exceeds demand.
